

STREAMLINING IT PROCUREMENT: AUTOMATING STANDARD LAPTOP ORDERS WITH FLOW DESIGNER

PHASE 2 – REQUIREMENT ANALYSIS

2.1 Introduction

The requirement analysis phase identifies the functional, non-functional and platform requirements needed to implement the Standard Laptop Procurement Automation project. The requirements are based on the need to process a laptop request through ServiceNow and automate the task creation and assignment after approval.

2.2 Problem Requirements

The system should reduce manual work involved in processing standard laptop requests. Once a request is submitted and approved, the required fulfillment task should be created and assigned automatically to the Hardware team.

2.3 Functional Requirements

Requirement	Description
Standard Laptop Request	The system must provide a Standard Laptop request through the Service Catalog.
Request Submission	The system must allow a user to submit a laptop request.
Approval Process	The request must go through the required approval process.
Flow Automation	The system must use Flow Designer to automate the post-approval workflow.
Catalog Task Creation	The flow must create a Catalog Task after the laptop request is approved.
Hardware Assignment	The Catalog Task must be assigned to the Hardware team for configuration.
Request Tracking	The system must allow the status of the request and related task to be tracked.
Consistent Processing	The workflow must process approved requests consistently without requiring manual task creation.

2.4 Non-Functional Requirements

Requirement	Description
Reliability	The workflow should execute correctly after the required approval is completed.
Consistency	Approved Standard Laptop requests should follow the same defined workflow.
Usability	The Service Catalog request should be simple for users to submit.

Maintainability	The Flow Designer configuration should be understandable and manageable.
Efficiency	Automation should reduce the time and manual effort required to create and assign fulfillment tasks.

2.5 User and Role Requirements

Role	Responsibility
Requester	Submits the Standard Laptop request through the Service Catalog.
Approver	Reviews and approves the submitted request.
Hardware Team	Receives the automatically created Catalog Task and performs laptop configuration.
ServiceNow Administrator	Configures and maintains the Service Catalog and Flow Designer workflow.

2.6 ServiceNow Component Requirements

Component	Purpose
Service Catalog	Provides the Standard Laptop request.
Requested Items	Represents the submitted laptop request.
Approvals	Controls the approval stage.
Flow Designer	Automates the procurement workflow.
Catalog Tasks	Represents the laptop fulfillment activity.
Hardware Team Assignment	Ensures the fulfillment task reaches the team handling laptop configuration.

2.7 Input and Output Requirements

The main input of the system is a Standard Laptop request submitted by the user through the Service Catalog. After submission, the request enters the required approval process. Once the request is approved, Flow Designer processes the request and initiates the fulfillment workflow. The expected output is an automatically created Catalog Task assigned to the Hardware team for laptop configuration and fulfillment.

2.8 Process Requirements

The required process begins with the submission of a Standard Laptop request through the Service Catalog. The request then proceeds through the required approval stage. After approval, Flow Designer automates the fulfillment process by creating a Catalog Task and assigning it to the Hardware team. Each stage must be completed in the defined order to ensure that the request is processed correctly.

2.9 Validation Requirements

Validation	Expected Result
Standard Laptop request submission	The request should be submitted successfully.
Approval process	The approval process should be triggered for the request.
Flow Designer execution	The workflow should be executed after approval.
Catalog Task creation	A Catalog Task should be created automatically.
Hardware assignment	The Catalog Task should be assigned to the Hardware team.
Request and task tracking	The request and fulfillment task should be viewable and trackable.

2.10 Requirement Analysis Summary

The requirement analysis establishes the components and behaviour required for the Standard Laptop Procurement Automation project. The solution must connect the Service Catalog, Requested Items, Approvals, Flow Designer and Catalog Tasks so that an approved laptop request can be processed automatically and assigned to the Hardware team.
